| Review Problem   |
| Fatty acids present in fish oil may be useful for treating some psychiatric disorders. An article reporte September 3, 1998 at the Yahoo Health website described a randomized experiment done by a Harvar Medical School researcher in which 14 bipolar patients received fish oil daily, while 16 other patients received a placebo daily. After four months, 9 of the 14 patients who received fish oil had responded favorably, but only 3 or the 16 placebo patients had done so. |
| a. Calculate and interpret a 90% confidence interval for the difference between the proportion<br>showing favorable response in the two groups.  |
| b. Comment on the accuracy of the interval.  |
| <ul> <li>c. If the medical school researcher used a double-blind procedure, explain how the experimer<br/>would be set up.</li> </ul>  |
